This is one of two preferred proteins (the other in AAW6543) that have been isolated from Rana pipiens oocytes. Both proteins have a blocked amino terminal group and are essentially free of carbohydrates. The proteins are used to treat tumours. Use of the peptides has fewer treatment of tumours in the

Onc, a ribonuclease from Rana pipiens occytes, is known as an antitumour agent (e.g. for treating pancreatic cancer) and inhibitor of human immunodeficiency virus type-1 replication. It can be used therapeutically or as a cell-culture selection agent, e.g. to identify gene therapy compositions able to inhibit tumour growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   "this Gln is autocyclised to pyroglutamic acid"

                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                     The present sequence represents a frog ribonuclease protein (ranpirnase) (RNase). The specification describes a synthetic ribonuclease protein, in which the addition of cysteine in the ribonuclease facilitates the chemical linking of a targetine molecule by the single reactive sulfhydryl group. The specification also describes a method for the production of rampirnase using DNA technology instead of processing biological material. The re-engineering of the protein molecule allows easier attachment to a targeting molecule thereby making it possible for mich, he more effective to a particular cell receptor where it
                                                                                        New nucleic acids encoding a ribonuclease (Rnase), useful for the precise targeting of Rnase to a predetermined cell receptor.
                                                                                                                                                                                                                                                                                                                                                                            9

            nucleic acid encoding ribonuclease protein with N-terminal Met at position 1 and Glu at position 1, where its Met has been cleaved and its Glu has been autocyclised. The method of the invention involves subjecting pETI1d-ronc(Q1,M21) plasmid DNA to two different site-directed mutations, each using overlapping PCR protocol. The method is useful for constructing an isolated mucleic acid encoding the ribonuclease. The present amino acid sequence represents the northern leopard frog rampirnase protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences AAW35125 to AAW35135 represent recombinant fusion proteins (ronc) which are modifications of the Rhase Onconase (RTW) (nonc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to nonc and also
                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ribonuclease molecules based on native Onconase - used for killing cells, particularly tumour cells.
invention relates to a new method of constructing isolated

This sequence represents a recombinant Onc protein comprising a 104 amino acid sequence having Gln at position 1. Onc, a ribonuclease from Rana pipiens occytes, is known as an antitumour agent (e.g. for treating pancreatic cancer) and inhibitor of human immunodeficiency virus type-1 replication. It can be used therapeutically or as a cell-culture selection agent, e.g. to identify gene therapy compositions able to inhibit tumour growth

The protein is derived from fertilised frogg eggs. It has an iso-electric point of 9.5 - 10.5, a blocked N-terminal gp. and is free of carbobydrates. It is active against certain cancer cells. The combination of the protein and (z-1-p-dimethylaminoethoxyphenyl-1, 2-diphenyl-1-butene) citrate salt (Tamoxifen) is much more bio-active than the separate entities against human pancreatic ASPO-1 adenocarcinoma, and the combination of protein and (10-[3-(4-methyl] piperazin-1-yl)-propyl]-2-trifluoromethylphenothiazine (Stelazine) is much more reactive than the separate entities against human lung A-549 carcinoma. Activity has also been shown against human sub- maxilliary epidermoid carcinoma A-253 cells, human colo 320 DM carcinoma NIH-OVCAR-3 cells, human leukaemic squamous car- cinoma HT-520 cells, human LOX melanoma and human lung aguamous car- cinoma HT-520 cells

This pharmaceutical protein (ONCONASE) is used in the production of a bloactive pharmaceutical composition also comprising one of Cisplatin (as-diamminedichloroplatinum), Melphalan, (4-bis-(2-chloroethyl)amino)-L-phenylamine) or Adriamycin (Doxorubicin HCl). The composition has bloactivity in vitro against OYCAR-3 human ovarian adenocarcinoma cells. (Updated on 25-MAR-2003 to correct PN field.)

Patent No. 5595734
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Ardelt Ph.D, Wojciech J.
APPLICANT: Mikulski, Stanislaw M.
TITLE OF INVENTION: PHARMACEUTICAL FOR TREATING TUMORS IN HUMANS
NUMBER OF SEQUENCES:
ADDRESSEE: Mark H. Jay, P.C.
STREET: P.O. Box 020083, General Post Office
CITY: Brooklyn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 104;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 SEFYLSDCNVTSRPCKYKLKKSTNKFCVTCENQAPVHFVGVGSC 104

pancreatic ribonuclease (EC 3.1.27.5) - minke whale
NyAlternate names: RNase 1; RNase A
C)Species: Balaenoptera acutorostrata (minke whale, lesser rorqual)
C)Bacide: 24-Apr-1984 #sequence_revision 24-Apr-1984 #text_change 03-Jun-1994
C)Accession: A00818
R)Emmens, M.; Welling, G.W.; Beintema, J.J.
B)cohem. J. 157, 317-323, 1976
A)Title: The amino acid sequence of pike whale (lesser rorqual) pancreatic ribonuclease.
A)Reference number: A00818; MUID:76277855; PMID:962870
A)Recession: A00818; MUID:76277855; PMID:962870
C)Superfamily: pancreatic ribonuclease
C)Residues: 1-124 < EMM>
C)Superfamily: pancreatic ribonuclease
C)Reywords: glycoprotein; hydrolase; nucleic acid digestion; pancreas
C)Reywords: glycoprotein; hydrolase; nucleic acid digestion; pancreas
F)12,41,119/Active site: His, Lya, His #status predicted
F)26-84,40-95,58-110,65-72/Disulfide bonds: #status predicted
F)76/Binding site: carbohydrate (Asn) (covalent) (partial) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      coypu and chinchilla pancreatic
                                                                                                                                                                                                                7;

phosphates and 3'-phosphooligonucleotides ending in C-P or U-P
with 2',3'-cyclic phosphate intermediates.
-!- SUBCELULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zhang J., Rosenberg, P.E.,

"niversifying selection of the tumor-growth promoter angiogenin in primate evolution.";

Mol. Biol. 19:438-445(2002).

--- FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs (By similarity).

--- SUMCELIULAR LOCATION: Secreted.

--- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                             ---PCKYKLKKS

to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs. Binds tightly to placental ribonuclease inhibitor and has very low ribonuclease activity. SubcELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Server and milk.
SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ----EFQ

Biophys. Acta 453:400-409(1976).

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-phosphates and 3'-phosphooligonucleotides ending in C-P or U-P with 2', 3'-cyclic phosphate intermediates.
-!- SUBCELIULAR LOCATION: Secreted.
-!- INSUE SPECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                53 ASKNVLTTFEFY----LSDCNVTSRP----CKYKLKKSTNTFCVTCENQ--APVHF 98
Eur. J. Biochem. 75:91-100(1977).
-!-CATANTUR CATTUTTY: Endonucleotide sending in C-P or U-P phosphates and 3'-phosphooligonucleotides ending in C-P or U-P with 2',3'-cyclic phosphate intermediates.
-!-SUBCEILULAR LOCATION: Secreted.
-!- SUBCEILULAR LOCATION: Pancreas.
-!- TISSUE SPECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.

Mol. Biol. Bvol. 19:438-445(2002).
-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds
-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds
to actin on the surface of endothelial cells; once bound,
angiogenin is endocytosed and translocated to the nucleus, thereby
promoting the endothelial invasiveness necessary for blood vessel
formation. Angiogenin induces vascularization of normal and
malignant tissues. Abolishes protein synthesis by specifically
hydrolyzing cellular tRNAs (By similarity).
-!- SUBCELLULAR LOCATION: Secreted.

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds
-!- cactin on the surface of endothelial cells; once bound,
angiogenin is endocytosed and translocated to the nucleus, thereby
promoting the endothelial invasiveness necessary for blood vessel
formation. Angiogenin induces vascularization of normal and
malignant tissues. Abolishes protein synthesis by specifically
hydrolyzing cellular tRNAs.

Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch)
promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tENRAs (By similarity).

SUBCELLULAR LOCATION: Secreted.
SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                   EMBL; AP441666; AAL61648.1; -

for New recombinant ribonucleases, used for killing target cells, e.g. treating cancers, viral infections or autoimmune diseases.

Claim 34; Page 57; 71pp; English.

The present sequence is a recombinant Rana pipiens ribonuclease (RaPLR1) protein with Met at position 1. Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant

cancerous B cells or human chorionic gonadotrophin (hCG) effective

                                                                                                                                                                                                                          09
ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in frame with ligand binding moieties to form cycotoxic fusion proteins. They can be used for treatment of cancer and autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           'note= "(His)6 histidine tag attached to N-terminal Met'

Carboxy terminal end of RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer
     against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moleties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases

Carboxy terminal end of recombinant RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form contains.

It is encoded by Clone 5alb cDNA obtained from Rana pipiens liver mRNA library. It exhibits differences with Oncoase (RTM) at amino acid residues 11, 20, 85 and 103. Carboxy terminal end of RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerrous B cells or human chorionic conductorphin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytocoxic fusion proteins. They can be used for treatment of cancer and autoimmune

covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadorrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytocoxic fusion proteins. They can be used for treatment of cancer and autoimmune
                Recombinant Rana pipiens ribonuclease; RaPLR1 Gln1Ser; covalently bound; LL2 antibody; ligand binding moiety; CD22; cancerous B cell; frog; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein; cancer; RNase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is a recombinant Rana pipiens ribonuclease (RaPLR1) protein with Gln1Ser. Carboxy terminal end of recombinant RaPLR1 has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant ribonucleases, used for killing target cells, e.g. for treating cancers, viral infections or autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3 DWLTFQKKHLTNTRDVDCNNIMSTNLFHCKDKNTFIYSRPEPVKAICKGIIASKRVLTTS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a recombinant Rana pipiens ribonuclease (RaPLRI) protein with Met23Leu. Carboxy terminal end of recombinant RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hGG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune

AAW35115 to AAW35123 encode recombinant proteins (ronc) which are modifications of the RNase Onconase (RTM) (nonc). Such novel ribonuclease molecules are highly cyclotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cyclotoxic activity compared to nonc and also lower
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ribonuclease molecules based on native Onconase - used for killing cells, particularly tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MQDWLTFQKKGHLTNTRDVDCNNIMSTNLFHCKDKNTFIYSRPBFVKAICKGIIASKNVLT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      have been isolated from Rana pipiens occytes. Both proteins have a blocked amino terminal group and are essentially free of carbohydrates. The proteins are used to treat tumours. Use of the peptides has fewer disadvantages than chemotherapy, radiotherapy and surgery in the treaturent of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2 QDWLTPQKKHLTNTRDVDCNNIMSTNLFHCKDKNTFIYSRPEPVKAICKGIIASKNVLTT

```
Sequences AAW35125 to AAW35135 represent recombinant fusion proteins (rOnc) which are modifications of the RMase Onconase (RTW) (nOnc). Such novel ribonuclesse molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can stoo be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonuclesses have increased cytotoxic activity compared to nonc and also increased.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          251 MEDWLIFQKKHITNTRDVDCDNINSTNLFHCKDKNTFIYSRPEPVKALCKGIIASKNVLT 310
                                                                                                                                                                                                               Ribonuclease molecules based on native Onconase - used for killing cells, particularly tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 MQDWLTFQKKHLINTRDVDCNNIMSTNLFHCKDKNTFIYSRPEPVKAICKGIIASKNVLT 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                à
                                                                                                                                                                                                                                                                                                         This sequence represents recombinant frog Onconase. Onconase has ribonuclease and anti-tumour activity. The CDNA was produced via PCR (using primers AAZ19769) of two synthetic DNAs whose sequences encoded most of the N-terminal or the C-terminal amino acids of mature onconase. The two PCR products generated encoded either the N-terminal 54 amino acids (minus the initial methionine) or the C-terminal 51 amino acids, and were ligated in frame at an Nrul site. The CDNA was then subcloned into a vector e.g., pBluescript, where the ATG initiation codon subcloned into a vector e.g., pBluescript, where the ATG initiation codon was ligated to the CDNA. After expression in E. coli, the recombinant crot protein was purified. The initial N-formyl methionine was cleaved off and the now N-terminal glutamate residue cyclised to form an N-terminal CC the now N-terminal glutamate residue forms part of the phosphate by proglutamate residue forms part of the phosphate collection activity. Onconase is a 12 No ribonuclease and anti-tumour activity onconase is a 12 No ribonuclease which causes cell cannous minovlving inactivation of protein synthesis by a companion in incolving inactivation of protein synthesis by a mammalian placental ribonuclease inhibitor, which may explain its cantivity against a variety of solid tumours e.g. colon or pancreatic cancers, and can be used alone or in combination with other anti-tancer agents such as tamoxifen. When used as an anti-tumour agent, Onconase can be conjugated to a marker which targets it to a specific cell type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;

(ronc) which are modifications of the RNase Onconase (RTM) (nonc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new increases have increased cytotoxic activity compared to none and also lower immunocentifit, in human human cativity compared to none and also Ribonuclease molecules based on native Onconase - used for killing cells, particularly tumour cells. fusion proteins (ronc) which are modifications of the RNase Onconase (RTM) recombinant Sequences AAW35125 to AAW35135 represent Disclosure; Page 72; 90pp; English lower immunogenicity in humans

g useful Recombinant Onc protein with glutamine residue at position 1 - useful antitumour and antiviral agent, also as cell culture selection agent.

Claim 1; Page 28; 35pp; English.

This sequence represents a recombinant Onc protein comprising a 104 amino acid sequence having Gln at position 1. Onc, a ribonuclease from Rana piptens cocytes, is known as an antitumour agent (e.g. for treating pancreatic cancer) and inhibitor of human immunodeficiency virus type-1 replication. It can be used therapeutically or as a cell-culture

nucleic acids encoding a ribonuclease (Rnase), useful for the precise geting of Rnase to a predetermined cell receptor. targeting

Claim 1; Col 5-6; 7pp; English.

(RNase). The specification describes a synthetic ribonuclease protein, in which the addition of cysteine in the ribonuclease facilitates the chemical linking of a targeting molecule by the single reactive sulfhydryl group. The specification also describes a method for the production of rampirnase using DNA technology instead of processing biological material. The re-engineering of the protein molecule allows easier attachment to a targeting molecule thereby making it possible for the ribonuclease to be delivered to a particular cell receptor where it The present sequence represents a frog ribonuclease protein (ranpirnase) be most effective

The method of the invention involves subjecting pETIId-ronc(Q1,M23L) plasmid DNA to two different site-directed mutations, each using overlapping PCR protocol. The method is useful for constructing an isolated nucleic acid encoding the ribonuclease. The present amino acid sequence represents the northern leopard frog ranginase protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 QDWLTFQKKHITNTRDVDCDNIMSTNLFHCKDKNTFIYSRPEPVKAICKGIIASKNVLTT 60
